Clinical profile of chronic kidney disease of unknown origin in patients of Yavatmal district, Maharashtra, India

Dhananjay Ookalkar1, Ashwini Ookalkar1, V.L. Gupta1, Manish R Balwani2*

Abstract
We present a case series of patients with chronic kidney disease of unknown etiology (CKDu) coming from a well-defined geographic area, Yavatmal, district of Maharashtra, in central India. These patients presented with advanced renal failure, variable proteinuria, and bilateral hyperechoic kidneys, largely normotensive and belonged to poor economic class from agricultural communities. The study highlights the need for large epidemiological survey in Yavatmal region to detect patients with CKDu and investigate the possible etiology.

Keywords: Chronic kidney disease of unknown origin, Glomerular filtration rate, Proteinuria

Introduction
Chronic kidney disease of unknown origin (CKDu) has been reported from many hotspots across the globe from central America, Egypt, Srilanka, and coastal India (1). In the first report of Indian CKD Registry, CKDu is the cause of CKD in 18% of the population (2). The study of Global dimensions and perspectives of CKD by Jha et al have shown that the poorest populations are at the highest risk (3).

Patients and Methods
It is a single center retrospective study carried out at Ashwini Kidney and Dialysis Centre Pvt Ltd, Nagpur, India where medical data of all patients diagnosed to have CKDu were retrospectively reviewed. All patients from Yavatmal district reporting between April 2018 till June 2019 were identified. Total 2365 patients were seen during this period. 357 patients were from Yavatmal district. Out of these, 19 patients fulfilled all the criteria as per the definition of probable and confirmed CKDu as given by the WHO group in Srilanka (4). Estimated glomerular filtration rate (eGFR) was calculated using CKD EPI (Chronic Kidney Disease Epidemiology Collaboration equation) formula. The eGFR and serum creatinine were estimated at intervals minimum 12 weeks apart. The KDIGO guidelines 2012 was followed for the staging (5). The inclusion criteria for probable CKDu were eGFR < 60 mL/min with at least two eGFR readings more than 12 weeks apart or proteinuria more than 150 mg/day or urine protein creatinine ratio of more than 0.15. Demographic, clinical, biochemical data were collected and analyzed.

Results
Sociodemographic profile
The mean age group was 55.42 ± 10.5 years with majority of the patients between the age group of 40 to 70 years (84.21%). There was a progressive increase in the number of patients for each decade beyond 30 years up to 70 years of age. CKDu was seen more in males as compared to females. Most of the affected patients belonged to Banjara community (73.69%) and remaining five patients (26.31%) were from other communities. The subject population has well water as the source of drinking water (100%) (Table 1).

Clinical and biochemical profile
At the time of presentation, mean serum creatinine was 3.8 ± 2.4 mg/dL and the mean eGFR was 23.85 ± 14.24 mL/min/1.73 m². As per KDIGO staging, 5 patients presented (26.31%) with stage 3, 7 patients (36.84%) with stage 4 and...

Histopathology

One patient underwent a kidney biopsy. Histopathological features showed 7 glomeruli of which 5 were globally sclerosed and the remaining two were normal by light microscopy. Foci of tubular atrophy and interstitial fibrosis (40%) were seen. Widespread flattening and loss of brush border of proximal tubules was noted. The interstitium showed diffuse mononuclear cell inflammatory infiltrate with few eosinophils. The blood vessels were normal. The biopsy was negative for immunofluorescence deposits. Kidney biopsy could not be performed in majority of the patients as kidney size was already small, or there were logistic issues.

Discussion

The Yavatmal district lies in the southwestern part of the Wardha-Penga-Waiinganga plain. The District lies between 19º 26' and 20º 42' north latitudes and 77º 18' and 79º 9' east longitudes. The District has an area of 13,582 km², and a population of 27,72,348 persons according to 2011 Census carried out by government of India. Most of the people of this district are engaged in agricultural activities. As per 2011 census, 24.59% of the total workers are engaged as cultivators and 54.55% of the total workers are engaged as agricultural labourers in the district. Together it constitutes 79.14 % of the total workers of the district (6).

They are exposed to various agrochemicals and extreme heat during their work. In this case series of a single specialty tertiary centre, there is a predominance of males amongst the affected (78.94%). This may be due to the fact that agricultural labourers and farmers are predominantly males. They are exposed to extreme heat while working due to which they have excessive sweating and continuous work without necessary water intake may lead to repeated dehydration. Such frequent dehydration episodes may cause subtle kidney injury which may go undetected. In a similar finding, young males were predominantly affected in the study on endemic nephropathy around the world (7). Author suggests that such hard working population must be made aware of importance of frequent hydration while working in such climatic conditions.

The age group in our study is nearly similar to the findings of Uddanam study where mean age of the subjects was 43.2 ± 14.2 years (range: 18–98). However, in their study 44.3% were men and 55.7% were women (8). Only five of the 19 patients had hypertension, and were on antihypertensive medications. All the patients had varying degrees of proteinuria, measured by the urine protein creatinine ratio but majority had proteinuria less than 1 gm per day. In a similar study in central America, there was little or no proteinuria (9). The lack of hypertension and proteinuria less than one gm per day in majority of our patients despite advanced CKD points possibly to tubulointerstitial pathology.

The article on global epidemic of CKDu (10) expresses concerns about the Tatapudi’s study (8) which does not
have prevalence data as there are no repeat measurements of serum creatinine. Also, the Tatapudi’s study does not address “long standing hypertension”. Our study has taken only the patients with repeat serum creatinine measurements at 3 months.

Hyponatremia was seen in six patients. Again euvolemic hyponatremia points towards the tubular pathology. Renal biopsy may help in arriving at anatomical etiology for which biopsy needs to be performed in earlier stages of CKDu. The kidney biopsy finding in our patient is consistent with CKDu biopsy findings compared in the study on global dimension of CKDu (11).

This case series although small in number and being a single centre experience, highlights the need for large epidemiological study in Yavatmal and adjoining districts. There is also need of CKDu registry in this area. This will help in identifying the geographic distribution of CKDu. Many suspected CKDu patients did not come for a follow up visit. Therefore many suspected CKDu patients could not be included as probable and CKDu patients in this study. This calls for better nephrology services in Yavatmal and adjoining areas.

**Conclusion**

Our limited sample study shows that CKDu affects mainly agricultural communities consuming well water. Although the total number of patients in this area must be many times more than the numbers reported here, only a registry and epidemiological study with protocol-based workup will help in bringing the true CKDu numbers to public notice.

**Limitations of the study**

Small sample size results could not be generalized.

**Authors’ contribution**

DO, AO & VG were the principal investigators of the study. DO, AO & VG were included in preparing the concept and design. DO and AO revised the manuscript and critically evaluated the intellectual contents. All authors participated in preparing the final draft of the manuscript, revised the manuscript and critically evaluated the intellectual contents. All authors have read and approved the content of the manuscript and confirmed the accuracy or integrity of any part of the work.
